cancer
the key

igger
by increasing the antigen
presentation in developing
cells and making them vis-
ible to the immune system.
The implication is that to
kill tumours, you need to
be turned into immune
cells.
Further research is now
under way to see how these findings
can be used in the development
of immunotherapies.
Professor Alan Cooke,
senior lecturer for the School
of Biomedical Sciences, said
the research was based on
the fact that many
tumours stimulate
the immune system.
This is an important new step
towards a new way that has
been shown to have been
very successful in many serious
cancers including lung,
breast and colon. Professor
Cooke said that it is
possible that the use of
immune surveillance
could be used to
prevent the tumours
from growing.
The research was
funded by the Cancer
Research Campaign and the
Department of Health.

ADMINISTRATION

taking care of business

Often there's not much room in the budget for things like business cards. But they project a level of professionalism to those you come in contact with. At vistaprint.com you can get 250 cards for free—there are 42 designs to choose from, and you just pay shipping and handling. You can make sure every parent you come in contact with can reach you at a moment's notice, which increases the trust and comfort level. It's a small price to pay.
